

Complete Guide: Unlock 90% of Antigravity's Power Using 3 Essential Plugins

Introduction

Antigravity is powerful on its own—but if you are not using the right plugins, you are leaving most of its potential unused.

This guide, created by [@dhavalbuildsai](#), walks you through **three essential plugins** that transform Antigravity into a reliable, production-ready, autonomous AI system:

1. **GSD (Get Sh*t Done)**
2. **Ralph Loop**
3. **CodeRabbit**

By the end of this guide, you will understand:

- What each plugin does
 - Why it matters
 - How to install and use it correctly
-

1. GSD (Get Sh*t Done for Antigravity)

What GSD Does

GSD divides a large project into **small atomic tasks** and executes them **in isolation**.

This directly solves two major AI problems:

- **Hallucination**
- **Context rot**

Instead of the AI attempting to reason about everything at once, it focuses on one precise task at a time.

Key Benefits

- Atomic task execution
- Higher accuracy
- Predictable outputs
- Long-term project stability

Installation Guide

Clone the repository:

<https://github.com/toonight/get-shit-done-for-antigravity>

- 1.
2. Follow the setup instructions in the repository README.
3. Register the plugin inside Antigravity as described in the documentation.

How to Use

- Define your project goal clearly
- Allow GSD to split it into atomic tasks
- Execute tasks independently
- Maintain clean context throughout development

2. Ralph Loop

What Ralph Loop Does

Ralph Loop is an **autonomous planning and execution agent**.

It:

- Reads your **PRD (Product Requirements Document)**
- Analyzes current progress
- Selects the **next atomic task**
- Builds the solution
- Validates correctness
- Loops until the required output is achieved
- Saves the final result

Minimal manual intervention is required.

Key Benefits

- Automated next-step planning
- Self-correcting execution loop
- Faster development cycles
- Reduced cognitive load

Installation Guide

1. Open **Antigravity**
2. Navigate to **Extensions**
3. Search for **Ralph Loop**
4. Install and enable the plugin

How to Use

- Provide a clear PRD
 - Start the agent
 - Let Ralph Loop plan, execute, validate, and iterate
 - Review saved outputs as tasks complete
-

3. CodeRabbit

What CodeRabbit Does

CodeRabbit is a **real-time AI code review platform**.

It:

- Reviews code as it is written
- Identifies bugs before runtime
- Uses LLMs to suggest fixes
- Helps prevent production-breaking errors

Key Benefits

- Early bug detection
- Cleaner pull requests
- Higher code quality
- Safer production deployments

Installation Guide

Visit:

<https://www.coderabbit.ai/>

- 1.
2. Connect your repository

3. Enable real-time code reviews
4. Configure review preferences if required

How to Use

- Write or modify code normally
 - Allow CodeRabbit to review changes
 - Apply suggested fixes before merging or deploying
-

Recommended Workflow (Best Practice)

For best results, use all three together:

1. **GSD** – Break the project into atomic tasks
2. **Ralph Loop** – Plan, execute, validate, and iterate
3. **CodeRabbit** – Continuously review and fix code

This workflow ensures:

- Minimal hallucination
 - Autonomous execution
 - Production-ready outputs
-

Final Thoughts

Using Antigravity without these plugins is like running an autonomous system without feedback loops.

When combined, **GSD + Ralph Loop + CodeRabbit** unlock nearly the full potential of Antigravity.
